

A Climate Action Plan that will determine how the Santa Clara will reduce greenhouse gas (GHG) emissions in the City by at least 24% is being developed this year. Underway. The Plan compares business as usual and current sustainability measures with potential GHG reduction efforts to meet or exceed reduction goals required by State law. The baseline year is 2008 when it is calculated that Santa Clara had 1,854,300 metric tons of carbon dioxide emissions. If nothing changes, it is estimated that by 2020 emissions would total 1,885,800 metric tons, and the goal is to reduce that to at least 1,412,600 metric tons. Many strategies are being considered including more renewable energy, energy efficiency programs, water conservation, waste reduction, transportation alternatives and new land use policies.
